

VACUUM - A SAFE SOLUTION BASED ON EXPERIENCE

For more than 15 years we have been supplying rescue and evacuation equipment together to the wind-power industry. During this time we have amassed extensive experience in the safety aspects both inside and outside a turbine. It is an absolute must to have the correct equipment ready for use, and trained personnel to be able to handle different emergency situations that can arise.

Problems that can occur:

- Corrosion due to condensation when the temperature varies between cold and hot.
- Vibrations that cause wear-and-tear to any equipment that is not securely affixed. Based on many years' experience we have developed a patented vacuum package. The vacuum packaged bag guarantees that condensation water cannot appear, as there is no air. Furthermore it is impossible for the packaged components to wear down or rub against each other as they lie still in the vacuum bag.

Extra features

Our experience shows that inspection intervals are at least once every 10 years thanks to the vacuum packaging. As the vacuum package is unique and patented there is no comparable or better solution on the market.

Additionally, an unopened vacuum package is also both easy and quick to inspect in position, which gives the customer the chance to make significant savings in connection with the annual inspection.
